

Arrowhead plants (*Sagittaria sagittifolia*) can have very different forms, depending on whether they grow on land or in water. Why are they still considered to be the same species?

- A They can interbreed.
 - B They compete with one another.
 - C They have the same nutritional requirements.
-

Regardless of their appearance, if under natural conditions, individuals can interbreed and produce viable offspring, they are considered members of the same species.

Answer **A**.
