

Given two identical lenses, $f_1 = f_2 = f$. The object is located at a distance $p_1 = 2f$ from lens #1. The separation is $d = 5f$.

Based on the ray diagram determine the property of the image formed by the two lens system.

- A) The image is upright and real.
- B) The image is upright and virtual.
- C) The image is inverted and real.
- D) The image is inverted and virtual.

We indicate the situation qualitatively, and leave the construction of an accurate diagram to the reader. The image formed by lens #1 is inverted and real. It becomes the object of #2. The image formed by #2 is again real and inverted. Put all together, the final image is upright and real.

Answer **A**.
